Q: Shopping Cart and Return policy I am working on a site where customers can have their shopping cart in one site but can then return to the same cart in a different site. I have my return data coming from the same site so am unsure on the return policy of such a shopping cart. Example: My shopping cart is in www.example.com/shopping_cart and is linked to my cart on www.example.com/checkout. But on my website www.example.com/checkout_return I have the same cart with the items in it. So if I buy an item on www.example.com/shopping_cart and then proceed to www.example.com/checkout_return and then back to www.example.com/shopping_cart, can I be expected to have the same items in my cart or do they need to be deleted? And on a similar vein, if I had the above scenario in reverse order, do I need to have the same items in my cart on the return site as on the purchase site, or would the cart be empty? The above is for more than one site, but I also had the scenario of a purchase on www.example.com/checkout_return, then returning to www.example.com/shopping_cart and it actually deleting the items that were on the cart on www.example.com/checkout_return. Thank you A: I had a similar situation where we were selling books on a website and a customer could return their book to us at any time after purchasing it. In order to reconcile purchases and returns we had to ensure that we had the most up to date cart on the return website. That meant that there was some work for us to ensure that when a user checked out from one website, they'd get their cart updated as well so that it matches that of the other site. Here's a rough outline of what we did to reconcile cart content for book returns. We only applied the following to book

purchases and returns. Upon a purchase 2d92ce491b
