Efficacy of thoracic radiotherapy in the treatment of limited small cell lung cancer in patients with limited stage. To analyse the efficacy of thoracic radiotherapy for limited stage small cell lung cancer (LSSCLC) and to identify factors that could influence the outcome. Retrospective chart review of LSSCLC patients who had limited stage disease and received thoracic radiotherapy in our institute from January 1988 to December 2004. Univariate and multivariate analyses were performed to assess the efficacy of thoracic radiotherapy. The primary end point was overall survival (OS). Two hundred and twenty-three patients were enrolled. At a median follow-up of 54 months, the 5-year OS was 18.6%. The 5-year OS of patients with limited stage and 0-2 mediastinal lymph nodes (MLNs) was 24.2% versus 13.6% with ≥ 3 MLNs ($P = 0.027$). The multivariate analysis showed that age ≥ 65 years ($P = 0.041$), ECOG performance status ≥ 1 ($P = 0.009$), and tumour size ≥ 20 mm ($P = 0.037$) were associated with inferior OS. For patients with LSSCLC, chest radiotherapy provides a survival benefit in patients with limited stage disease with 0-2 ML
