And finally, I was able to download. This is by far the best free application that I have found. I decided to post it here because it did not meet the required requirements of the "How To" forum. I have an old version of Quark but this is just for you. I will try to get a working copy of the XP version. First let me say that this is the best application that I have found so far. I am so sorry if you already have it installed. If you are using a multi-level Windows and have installed it correctly the first time you can run "Quarkxpress.exe /setup" then "quarkxpress.exe". This should set up the software for you. If you have problems with "quarkxpress.exe" try it from an account that has the correct privileges to run it.

September 11, 2012. Mac OSX's FindMyMac application is a complete "Lost iPhone" solution. One of the most dangerous situations you may find yourself in is to have lost your cell phone, and you need to find it. Knowing that you are in this situation is not enough, though. How do you find the phone if you can't remember what its' location is? How do you find it if you don't know its' location in the first place? As if this wasn't bad enough already, the iPhone is tied to your iCloud account and is not directly tied to your own address book, and thus, you need to be very careful of what you say about this device. There are two apps that are currently available which will help you with the search for the lost iPhone. One of the better ones is the Find My iPhone app. With this app you can locate the iPhone and even disable its' services. There is a password protection that must be entered at the time of the disable, so this is useful in situations where the iPhone is not in your possession. The app also provides you with an option to remotely erase the iPhone. In situations where the phone is turned off, the phone will usually lock the screen itself if it has been used before. This happens by simulating a lock and a wrong password. You are, of course, in the situation where you do not know the password, so finding the device becomes a bit more difficult. What you can do is to use Find My iPhone which can force it to give up 2d92ce491b
