18 x 15918 Let's break it down to the basics. "expose_to_edit" is the number of faces that we want to be editable in the source mesh. "userspace" tells Blender which side will be used for the viewport and for UI, but it's useful to keep in mind here if you're editing the mesh. You can see that it's using the top half of the source mesh (which makes sense since the viewport will be on the top face and the Blender UI will be on the bottom half). You can see the "Import OB" button on the right corner as well. This has to be clicked and a model is imported into the top half of the source mesh. In our example, we set "expose_to_edit" to 5 and set "userspace" to 1. This gives us five faces that can be editable and one which can't. You can check this by selecting faces 1, 2, 3, 4, and 5, and then pressing ALT + F to select everything. Then check out the "face selection" setting at the bottom of the 3D view (see Figure 6-8). You'll notice that the faces are not selected when we select all faces in 3D view, but they will be in the viewport. Figure 6-8. The faces exposed to edit in a mesh and the selected faces for the viewport. Now, you can't change the mesh in the editor. This is because we have no object that we could work on. In order to work on this mesh, you'll need to have it in the 3D viewport. To load an object into the viewport, you need to click on the button on the right side of the 3D view called "3D View". This is shown in Figure 6-9. Figure 6-9. Loading a 3D object into the 3D view. Now, you can work on the mesh. You can rotate and scale it to your heart's content (see Figure 6-10). Figure 6-10. The 3D viewport showing the mesh object ## Saving Changes Once you've finished your work, it's best to save it and then reimport the 3D object from your file. The reason you do this is because you don't want to edit the same object twice. Blender is easy to use, but you
