Zip Start Xl Jump Starter Emergency Batter Durapro. Category:Starters Category:Automotive accessoriesQ: How to have a task depend on a task with a side-effect? In my Makefile, I have a target that calls both task A and task B: task\_a: A \$(call task\_b) task\_b: @echo "This happens as soon as task A finishes." If I don't want to have task\_a depend on task\_b, I can use -j1 instead of @echo "This happens as soon as task A finishes.". Is there a way to make the task\_b task depend on the task\_a task, but still have task\_b run before task\_a finishes? A: You can do that with some task/command manipulation. task\_b: A \$(call task\_a,\$@) task\_a: @echo "This happens as soon as task A finishes." The trick is to use: \$@ as the second argument to the function task\_a. \$@ expands to the value of the first argument of the function task\_a. In task\_b: A expands to the value of the first argument of task\_a, which is the value of the first argument of task\_b. Thus you get the effect that you want, a task\_b: task\_a task\_b. Search This Blog Friday, August 28, 2014 GRA is ready to say goodbye to their customer-acquisition team and upgrade their tool set to allow them to focus on bringing new products to market and growing their business. When a new feature is complete, they'll need to push it out to everyone, and they'll need to be able to track this activity without manually entering the data. This could be a daunting task for the average CRM user, which is why GRA's turned to XGRA.
