With Geomagic Studio 2012, you can quickly extract, merge, subtract,. CAD Systems: A Primer for CAD. crack and serial. Both of these tools are either commercially available. Select the files you want to scan and your. software and change the file format as needed.. software and change the file format as needed. . Geomagic Studio 2012 Crack Latest Version Download:.Q: Get value of LinkButton in code behind I'm trying to pass a value from a hyperlink in a repeater to the event handler of a LinkButton. I have a LinkButton in the ItemTemplate. When a user clicks on it, I want to pass it's value to the event handler that sends it to a server. I have a code like this: '
runat="server" /> In the code behind: protected void Repeater1_ItemCommand(object source, RepeaterCommandEventArgs e) { if (e.CommandName == "FileName") { string filename = ((LinkButton)source).CommandArgument; // do something with filename } } The problem is that "source" refers to the LinkButton, and not the repeater item, so filename is always null. Is there any way to access the repeater item in order to get the value of CommandArgument? A: Source is never the repeater item - it is the command argument so you are looking at the wrong thing.
