1. Field of the Invention The invention generally relates to turbomachinery. More particularly, the invention relates to a passive turbomachine. 2. Description of the Related Art A passive turbomachine, such as a passive turboprop engine, includes a housing having an inlet, an outlet, and a radial flow impeller, such as a radial fan impeller. The impeller includes an impeller core, a plurality of blades, and an end cap. The impeller is positioned within the housing so that the radial fan impeller rotates within the housing. The impeller draws an inlet air into the housing at the inlet, and then expels the inlet air out of the housing at the outlet. For example, during certain conditions, it is desirable for the impeller to deliver inlet air to the housing at a rate that is less than a predetermined amount, such as less than the inlet air flow rate at which the turboprop engine operates in a nominal or standard operating condition. Such a condition occurs, for example, when an aircraft is flying an approach to a landing under conditions that are sub-optimal for the turboprop engine, such as during a night landing. In such conditions, it is desirable to reduce the amount of in
