The KEYMACRO device is part of the International Business Machines (IBM) System 390 series of System/370 and System/390 computers. The KEYMACRO has eight additional data input/output pins that are connected to the ports on the system board and can be used for user input and output. USER Commands: The KEYMACRO is under the control of the user via a program called USER. USER is a built-in program to which you can add any number of commands. In this course, we will only use one command called KEYMACRO. USER Commands: The keymacro command displays the full memory map and the status of memory (free, busy, etc). It displays the status of the memory locations, and the status of the RAM input pins, and the status of the data output pins. SCAN Commands: The KEYMACRO is under the control of the Scan Program. The Scan Program is a separate user program from USER. The Scan Program can run any number of applications that it defines. The Scan Program can run a program in user mode, system mode, or privileged mode. In the default mode of a Scan Program, it will run the system programs in privileged mode. SCAN Commands: We will be starting the Scan Program from the KEYMACRO so that we can run the command display to view the memory map of the system. From the Keymacro, we will start the Scan Program from the Memory Map command to display the data of the memory locations. SYSTEM Commands: The SYSTEM command is used to run the system applications and help programs. It can be used to run user programs in system mode, and to run privileged programs in system mode. SYSTEM Commands: For the Keymacro to control the RAM, we need to get the full memory map to view the data of the memory locations. Applications: For the Keymacro to control the RAM, we need to get the full memory map to view the data of the memory locations. Shortcuts: The KEYMACRO does not have any keyboard shortcut to perform any of the operations shown. We will now be using the keyboard to perform all the operations and get the results.
