Ephemeral pools are a transient natural resource in arid and semi-arid regions, but they are currently experiencing widespread decline. Studying the impact of these bogs on their associated microbial communities may help elucidate the ecological and physiological mechanisms that maintain this biota. We tested the hypothesis that these communities are sensitive to changes in sediment load. Here we compare both bacterial community structure and physiological functions in submerged sediments of ephemeral pools before and after a 50% increase in sediment load. We found a positive relationship between the magnitude of sediment load and bacterial growth rates in three separate seasons. Overall, water chemistry and bacterial community structure were similar between pools with different sediment loads. However, 54b84cb42d
