Before AutoCAD and other CAD programs were introduced, a graphics department had to be created within a business to develop CAD drawings and architectural designs. Until that time, most businesses had no real need to design or draft anything. AutoCAD's evolution from its first release in 1982 to its current

version, AutoCAD 2018, is reflected in the application's name and user interface. In the years that followed the introduction of AutoCAD, the application underwent many changes. Some changes were small, while others were huge. And for every change, there was always a reason behind it. Looking back, I believe that the most important reason behind AutoCAD's rapid evolution was the simple reason that AutoCAD's developers wanted to constantly improve the application. Throughout the years, Autodesk has worked on improving AutoCAD with new features, functionality, and interfaces. Autodesk also tried to help users with how to use the application and at the same time keep improving the application. Back in 1982, CAD was a niche market. Even though a few companies like Autodesk were working on a CAD application, none of them was successful enough to become a mainstream desktop application. When AutoCAD came out in 1982, the main purpose of the software was to let users draw directly on a bitmap image of a page rather than use a display device such as a screen or a monitor. To understand how a user could draw on a bitmap image, it is important to know that the computer's memory is divided into fixed-size chunks called blocks. A block is the smallest unit of memory that the computer can use. Typically, the computer only

uses a few blocks at a time. For example, when a computer is using a block of memory to display a web page on a monitor, it uses one block of memory for the background colors, another for the text and images, and so on. When a CAD program is using the memory, it uses a block for the drawing area. So when the user starts drawing on the bitmap image, the drawing is created and displayed on the memory blocks being used to display the web page. If you look at the block usage in the image above, you'll notice that the blocks for the web page are still being used for other purposes. The area in the upper left corner of the screen is actually a bitmap image called the web browser window, which is the browser window on the computer's monitor

Q: Is there a better way to check if a string value contains a comma? A long time ago I learned how to check if a string value contains a comma using the regex method. This is what I learned: `string[] temp = { "1,2", "1,2,3", "4,2,5" }; foreach (string s in temp) { if (Regex.IsMatch(s, @"\d+", RegexOptions.IgnoreCase)) { //s = "1" } }` Using a regular expression is a very good way to check if a string value contains a comma. But I'm now finding that using the Regex method is very slow. Is there a faster way to check if a string value contains a comma? EDIT: By "a very good way to check if a string value contains a comma", I meant the method of using a regular expression. I want to avoid using a regular expression and use the

method of checking if the string contains a comma using a loop.

A: Since we have the guarantee that there is only one digit, we can use a simple `string.IndexOf(',')` check. A: a1d647c40b
