1. Field of the Invention The present invention relates to a cooler for a computer enclosure, and particularly to a manual cooler for efficiently and safely maintaining a heat dissipation structure in a computer enclosure. 2. Description of Prior Art A conventional heat dissipation structure for a computer enclosure is a fan. The fan is mounted to a fan motor, which is supported by a chassis. The fan motor is connected with an internal circuit board by a flexible cable. The fan motor is configured to rotate the fan and supply a suction airflow through the fan. The suction airflow is further provided to the heat dissipation structure and dissipates a heat of the internal circuit board. A power cable is mounted to the internal circuit board for providing a power to the internal circuit board. The fan motor generally is provided with a switch device to control the rotation of the fan. However, the switch device provided on the fan motor is generally directly mounted to the internal circuit board. Due to a relatively long distance between the switch device and the fan motor, a significant amount of heat is generated during rotation of the fan. The generated heat may gradually melt the switch device and lower the reliability of the switch device and the fan motor.
