because there are far more potential descrypt passwords than there are possible master passwords, it can be quite easy to crack a user's descrypt password. a single descrypt hash can be used to crack every descrypt hash with the same salt in a matter of minutes. that means that if a user has a single descrypt password and the corresponding salt, an attacker can crack that password in minutes. if that user has another descrypt password, the attacker can use the same salt and generate master passwords to crack any descrypt password that uses the same salt. usg ishimura production information class planet cracker-class manufacturer concordance extraction corporation length 5,300 feet (1.6 kilometres) technical specifications engine unit(s) shockpoint drive armament asteroid defense system cannons complement shuttles crew 1,332 [1] clerical: 65 colonial: 307 crew: 80 custodial: 88 extension/familial: 208 medical: 69 security: 89 service: 145 technical: 177 other: 104 usage role(s) planet cracking medical research and development in the end, zalp babaolu used his ability to crack the the other two uncracked hashes to find neukirchens. babaolu was able to crack the thompson, london, and fabry hashes with software that he says could have been purchased for a few hundred dollars. the three hashes were among the four uncracked ones that babaolu was able to crack. thompson babaolu says there are two ways to crack the thompson hash. one, a hash cracking program can be used, similar to

the one he used. the second involves having access to plaintext passwords to test against the cracked hash. that is the method neukirchen used. and that is what caught the attention of babaolu.

sometime between the three years that isaac clarke was interred on titan station, otherwise known as the sprawl, the usg ishimura ended up docked at the station with earthgov engaging in a thorough cleanup and refit operation within the ship, ostensibly to wipe all of the evidence of the necromorph infestation out. the necromorph infestation aboard the ship apparently dissolved once more after the loss of the marker shards recovered by the magpies, leading to its inert discovery by the sprawl's scientists. however, due to the presence of the site 12 marker located within the sprawl, it was not long before the necromorph biomass began reconstituting itself. in the weeks leading up to isaac's escape, the necromorph presence aboard the ishimura silently stalked the sprawl's technicians, leading to mass paranoia and panic within the cleanup crews. by the time of the necromorph outbreak within the sprawl, the ishimura was mostly restored structurally, though the cleanup effort was only partially completed. what are the implications of this technique? well, for starters, a user's passwords are much more susceptible to being cracked if they are also being hashed with a weak one-way function like descript. what's more, simply knowing a user's password does not allow an attacker to authenticate as that user. but because the descript hash has a predictable structure, a user's password is often all that is needed for a hacker to crack a user's account. "the descript hash is bad," gosney told ars. gosney said that if a user's password is only hashed with descript, then the attacker needs to know a master password that is also hashed with the same salt. this would be the same process as for a legitimate user, but the attacker would have to spend more time and resources to generate the master password. after that, it's only a matter of time before the attacker cracks the user's password. 5ec8ef588b
